

Savollarga javoblar

② Post training nima?

Post training - pre training orqali
organigan base modelni inson korekt
malumot, preference va feedback orqali
foydali va instruction-following modelga
moslashtirish jarayoni.

③ Pre training va Post training 3 ta ilohiy maqsad

Pre Tr: il va bolimni o'rganish
Post Tr: javob berish va in-solung yaxshilash
Data Pre Tr: Katta xajimdagi unlabeled text
Post Tr: Instruction, preference yoki feedback data
Misol: Pre Tr: juda katta GPU neurallari
Post Tr: Misbatan kamroq resurs.

③ Base model nega javob bera olmaydi?

chunki Base model asosan next-token
prediction uchun o'qitilgan. U instruction
dialog va foydalanuvchi niyatiga mos
javob berishga maxsus o'qatilmagan.

④ SFT, RLHF va DPO qanday data talab qiladi?

SFT: instruction → ideal answer juftliklari
RLHF: prompt + inson preference / feedback
odatda chosen/rejected yoki reward
signal.

DPO: prompt + chosen answer + reject answer
Aloqasi: SFT - ideal javob.
DPO / RLHF - preference.

⑤ Lora - SFT ga alternativa emasmi?
Ysq. Ular turli tushunchalar. SFT -
training usuli, Lora - parameter effi-
cient tuning usuli

⑥ Qaysi Method Colab T4 da ishlaydi
va nega?

Lora / Qlora + SFT T4 da eng qulay
ishlaydi, chunki ular modelning
barcha parameterlarini yangilamay
va VRAM ni ancha kam ishlatadi.
Full Fine tuning katta modelda T4 VRAM
etishmasligi mumkin.

⑦ Colabda base modelni yuklab
olgan javob da oladimi?

Ha Base modelni Loading Face da
yuklab, transformers orqali inference
qilish mumkin. Lekin u chat model
bo'lmagani uchun instruction
tuned model kabi sifatli javob
bermasligi mumkin.
