

LLM 2-oy 1-Davlat Report

Bosqichlar.

- ① Data → ② Data Preprocessing →
 - ③ Tokenizer → ④ Dataset → ⑤ Model
 - ⑥ pretraining → ⑦ Evaluation →
 - ⑧ Inference → ⑨ Deployment.
- Goal: Build our own LLM.

Google Colab - serverga ulanib villoq.

GPU - graphic processor unit - bitta
pretraining va training uchun kerak

VRAM - bu video karta

Server → Ram.

Training → VRAM.

Google
Colab

3 ta
narsa
sodda
qiladi

Colab ulash

VS Codedan extensionlar
dunafoladi jupyter va colab
song select kernel bosoladi
auto connect → song register
sog'a so'raydi → jadval yaratadi
va shu xolatda default
CPU ulangan bo'ladi

GPU - (NVIDIA) - organish, debugging
custom model building uchun.
Custom = B parameters model.

TPU (Google Custom Silicon) -
multi-billion parameter data
cluster training.

Google Colab Xususiyatlari

CPU - Best for data & code.
30 minutes long useable.
12 soatgacha run qilsa bo'ladi.

1 GPU - required for training
30 minut da ishlatadi, 12 soat makeable.

cloud TPU - 15 minut foydaga, 12 soat
makeable (Enterprise scale)

CPU dan GPU ga o'tish

① select another kernel

② Colab

③ New Colab Server (CPU, GPU or TPU)

④ Kernelni tanlab "Enter" bosiladi.

LLMlar qizisho qizib borib
joylarda RAG dan foydalaniladi

Pre Training

Objective → Collect → Clean →
→ deduplicate → build dataset →
→ train tokenizer → tokenization
→ real dataset build → pretraining
① design model → ② pretrain →
→ inference → deploy

SAVIO?

LLM model yasash uchun qaysi
dan dataset topamiz?

Bot eng ko'p foydalanadi
Ganduz bu - Hugging Face

Bu yerda turli datasetlar
bor ① text ② instruction

③ question-answering ④ conversation

⑤ translation ⑥ summarization

⑦ code ⑧ reasoning

yoki Kaggle platformasida
